

COVID-19 and the Future of Air Filtration

Joel Swann, Certified Air Filtration Specialist, Applications Engineer

(1) PDH: Virtual Presentation

September 2nd, noon

PRESENTED BY:

Joel Swann Introduction

jswann@aafintl.com

Cell: 678-362-6144

- HVAC Professional with 30+ years in design and manufacture of HVAC equipment
- Mechanical Engineering Bachelor of Science from University of Kentucky  University of Kentucky
- Certified Air Filtration Specialist by the National Air Filtration Association 
- ASHRAE Associate 
- Licensed Certified Residential Contractor by Florida Department of Business & Professional Regulation 

Agenda

- 
- 1 COVID-19 Background Summary
 - 2 Filter Change Out PPE
 - 3 Bypass Elimination
 - 4 Best Mitigation Strategy
 - 5 Quickest Mitigation Strategy
 - 6 Air Cleaning Technologies: UVGI, Air Purifiers
 - 7 Air Filtration Total Cost of Ownership

COVID-19 Background Summary

COVID-19 Disease Background Summary

What You Need to Know

What is the cause?

- A corona virus named SARS-CoV-2
- SARS-CoV-2 $\approx 0.12 \mu\text{m}$ in diameter (in other words 0.00000012 meters)

COVID-19 Research finds
SARS-CoV-2 viable in airborne
transmissions for up to 3 hours.

Transmission of SARS-CoV-2
through the air is sufficiently likely
that airborne exposure to the virus
should be controlled.

COVID-19 Disease Background Summary

Can SARS-CoV-2 be transmitted through the air?

COVID-19 Disease Background Summary

- Large droplets ($>100\ \mu\text{m}$) : Fast deposition due to the domination of gravitational force
- Medium droplets between 5 and $100\ \mu\text{m}$
- Small droplets or droplet nuclei, or aerosols ($< 5\ \mu\text{m}$): Responsible for airborne transmission

Ref. J.We, Y.Li:
American Journal
of Infection
Control 44 (2016)
S102-S108

COVID-19 Disease Background Summary

Airborne Disease Transmission modeling

Wells-Riley Equation: $C = S [1 - \exp(-I \times q \times t / Q)]$

Developed by Wells and Riley to model the airborne transmission of Tuberculosis and the Measles

C = New Infections

S = Susceptible (reduce # of susceptibles, social distancing)

I = Infectors (reduce # of infectors, temperature screening)

q = quantity of viral dose (reduce dosage/breathing rate by wearing PPE, washing hands)

t = time of exposure (reduce time in high risk areas)

Q = Quantity of Clean Air (increase virus-free air)

- More ventilation in Air Changes/Hour (ACH)
- More high efficiency air filtration

COVID-19 Disease Background Summary

What are current positions regarding airborne transmission of SARS-CoV-2?

Mechanical Air Filters:

- *Air filtration is moving from “Occupant Comfort” to “Life Safety”*
- HVAC Building Readiness Recommendations:
 - Increased ventilation
 - Increased filtration
 - Energy recovery
 - Building exhaust air re-ventilation systems plans
 - Entrainment control
- Recommend that mechanical filter efficiency be at least MERV 13 and preferable MERV 14 or better to help mitigate the transmission of infectious aerosols.

Source: <https://www.ashrae.org/technical-resources/building-readiness>

Engineering Controls for SARS-CoV-2 include:

- Installing high-efficiency air filters.

Source: <https://www.osha.gov/Publications/OSHA3990.pdf>

Consider improving the engineering controls using the building ventilation system:

- Improve central air filtration to the MERV-13 or the highest compatible with the filter rack, and seal edges of the filter to limit bypass.

Source: <https://www.cdc.gov/coronavirus/2019-ncov/community/guidance-business-response.html>

Transmission of SARS-CoV-2

- Airborne transmission of the virus can occur in health care settings where specific medical procedures, called aerosol generating procedures, generate very small droplets called aerosols.

Source: <https://www.who.int/news-room/commentaries/detail/transmission-of-sars-cov-2-implications-for-infection-prevention-precautions>

Filter Change Out PPE

Filter Change Out PPE

Maintaining Preventative Maintenance Schedules

- Refer to CDC Guidance on PPE use. The risks associated with handling filters possibly contaminated with SAR-CoV-2 under field-use conditions have not yet been evaluated. Updates will follow.

+

+

=

Properly Fitted Respirator
N95 Mask or higher

Disposable
Gloves

Protection suits
(full hooded coveralls, gowns)

Eye Protection
Safety Glasses, Goggles
or Face Shield

Disposable Foot Covers

Filter Change Out Procedural Additions

Maintaining Preventative Maintenance Schedules

1. Turn off the AHU.

2. Before touching the dirty filters, spray the face of the filter with disinfectant, followed by a fixate spray (i.e. hairspray)

3. Carefully remove the filters to minimize vibration and particle shedding.

Filter Change Out Procedural Additions

Maintaining Preventative Maintenance Schedules

4. Consider bagging filters, particularly if filters are suspected to be contaminated with SARS-CoV-2.

5. Dispose of bagged filters per normal procedures.

EXAMPLE 1

There are a variety of ways to safely remove PPE without contaminating your clothing, skin, or mucous membranes with potentially infectious materials. Here is one example. **Remove all PPE before exiting the patient room except a respirator.** If worn, remove the respirator after leaving the patient room and closing the door. Remove PPE in the following sequence:

- 1. GLOVES**
 - Outside of gloves are contaminated!
 - If your hands get contaminated during glove removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - Using a gloved hand, grasp the palm area of the other gloved hand and peel off first glove.
 - Hold removed glove in gloved hand.
 - Slide fingers of ungloved hand under remaining glove at wrist and peel off second glove over first glove.
 - Discard gloves in a waste container.
- 2. GOGGLES OR FACE SHIELD**
 - Outside of goggles or face shield are contaminated!
 - If your hands get contaminated during goggles or face shield removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - Remove goggles or face shield from the back by lifting head band or ear pieces.
 - If the item is reusable, place in designated receptacle for reprocessing. Otherwise, discard in a waste container.
- 3. GOWN**
 - Gown front and sleeves are contaminated!
 - If your hands get contaminated during gown removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - Unfasten gown ties, taking care that sleeves don't contact your body when reaching for ties.
 - Pull gown away from neck and shoulders, touching inside of gown only.
 - Turn gown inside out.
 - Fold or roll into a bundle and discard in a waste container.
- 4. MASK OR RESPIRATOR**
 - Front of mask/respirator is contaminated — **DO NOT TOUCH!**
 - If your hands get contaminated during mask/respirator removal, immediately wash your hands or use an alcohol-based hand sanitizer.
 - Grasp bottom ties or elastic of the mask/respirator, then the ones at the top, and remove without touching the front.
 - Discard in a waste container.
- 5. WASH HANDS OR USE AN ALCOHOL-BASED HAND SANITIZER IMMEDIATELY AFTER REMOVING ALL PPE**

PERFORM HAND HYGIENE BETWEEN STEPS IF HANDS BECOME CONTAMINATED AND IMMEDIATELY AFTER REMOVING ALL PPE

6. When maintenance complete, remove protective gear, and wash with soap & water or hand sanitizer.

Bypass Elimination

Quickest Filtration Mitigation Strategy

Seal Filtration Racks from By-Pass

Air filter bypass is a common problem, but now it is more critical than ever!

Bypass occurs when filter media is not properly sealed in the filter frame.

In order to have the filters perform as rated, air must be forced to pass through the filters.

- A 1 mm gap in the installation of a MERV 15 filter can reduce its efficiency to MERV 14*.
- A 10 mm gap (less than 1/4") can drop a filter's MERV rating by 2 levels*.
- Because higher efficiency filters typically have a higher pressure drop, bypass in those filters are more adversely effected.
- Source: ASHRAE Transactions, 2005:
Filter Bypass: Implications for Filter Efficiency

Quickest Filtration Mitigation Strategy

Seal Filtration Racks from By-Pass

Filter Frame Maintenance Tips

- Caulk or gasket cracks between filter frames.
- Gasket filter housing channel or frames.
- Gasket vertical sides between filters, frames, tracks and doors.
- Install all filter fasteners securely.
- Install all block offs and tighten in place.

Best Mitigation Strategy

Upgrade to HEPA Filtration

HEPA Filtration: 99.97% Efficiency at 0.3 μm

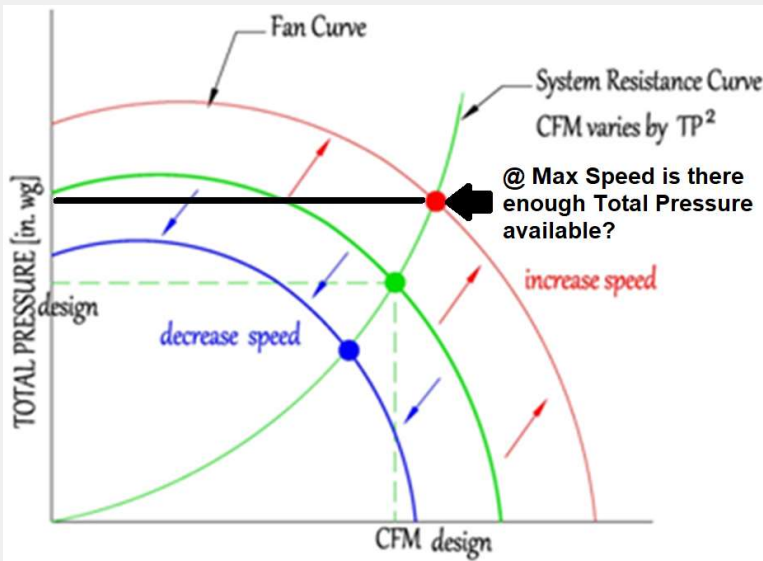

- Fragile small virus tend to move in the airflow by “piggybacking” on or within a slightly larger bioaerosol particle
- However, some early studies have shown the SARS-CoV-2 virus to be viable even when traveling alone.
- To address this viable situation, its individual size is approximately 0.12 μm , would require HEPA filtering efficiency.

Best Filtration Mitigation Strategy - HEPA

Upgrade to HEPA Filtration Systems – 99.97% Efficiency

- Consider Pressure Drop: Do you have enough fan static pressure?

Variable Air Volume System Fan Curve

Fixed Speed System Fan Curve

Best Filtration Mitigation Strategy

Upgrade to HEPA Filtration Systems

- Add racks: Is there serviceable clearance upstream of frame?
- Consider Door Clearance: Will the filter fit? Is it accessible by technician?

- Consider HEPA Filter Housings: Surelock B, Surelock C3, or Surelock C4

Best Filtration Mitigation Strategy

Pick the right HEPA Filter for the Job

Quickest Mitigation Strategy

Quickest Filtration Mitigation Strategy

Upgrade to ASHRAE MERV 16 Filters in Existing Racks, if possible

MERV 16 Filters are the highest efficiency per ASHRAE 52.2 rating!

MERV 16 filters remove more of the smaller aerosolized respiratory droplets (sized 0.5 μm to 5.0 μm), thereby capturing them and the SARS-CoV-2 virus that may be riding along.

| Particle Size Range (µm) | 0.40 - 0.50 | 0.55 - 0.70 | 0.70 - 1.00 | 1.00 - 1.50 | 1.50 - 2.00 | 2.00 - 3.00 | 3.00 - 4.00 | 4.00 - 5.0 | 5.0 - 7.0 | 7.0 - 10.0 |

MERV 16 Upgrade Considerations

Before Ordering New Filters, Verify Existing System Can Accommodate MERV 16 Requirements

- Consider Pressure Drop: Do you have enough fan static pressure?
- Consider MERV 16 Filters are 6-12" Deep with 1" Header: Will it fit in the rack and is there clearance in the AHU upstream and downstream of the rack.
- Consider Door Clearance: Will the filter fit? Is it accessible by technician?
- Add racks: Make sure there is serviceable clearance upstream of frame and through access door.
- Consider ASHRAE Filter Housings: SureSeal

Quickest Filtration Mitigation Strategy

Upgrade to Higher ASHRAE MERV Filters in Existing Racks

ANY Upgrade in Filters \leq MERV 8 Mitigates Risk of Bioaerosols in Air Stream

ASHRAE 52.2 MERV 13 are efficient at capturing aerosolized respiratory droplets sized $0.5 \mu\text{m}$ to $5.0 \mu\text{m}$, Therefore, the minimum recommended final filter rating is MERV 13, MERV 14 preferred, or as best achievable without diminishing air flow*.

* ASHRAE Guidance for Filtration Disinfection during the COVID-19 Pandemic, March 27, 2020

If constrained by available fan static pressure, filter rack size, or availability, consider any upgrade in MERV rated filters mitigates the percentage of bioaerosol particles in the air.

| Particle Size Range | Minimum Efficiency % | | | | | | | | |
|--------------------------|----------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| | MERV 8 | MERV 9 | MERV 10 | MERV 11 | MERV 12 | MERV 13 | MERV 14 | MERV 15 | MERV 16 |
| 0.3 - $1.0 \mu\text{m}$ | N/A | N/A | N/A | $E_1 \geq 20\%$ | $E_1 \geq 35\%$ | $E_1 \geq 50\%$ | $E_1 \geq 75\%$ | $E_1 \geq 85\%$ | $E_1 \geq 95\%$ |
| 1.0 - $3.0 \mu\text{m}$ | $E_2 \geq 20\%$ | $E_2 \geq 35\%$ | $E_2 \geq 50\%$ | $E_2 \geq 65\%$ | $E_2 \geq 80\%$ | $E_2 \geq 85\%$ | $E_2 \geq 90\%$ | $E_2 \geq 90\%$ | $E_2 \geq 95\%$ |
| 3.0 - $10.0 \mu\text{m}$ | $E_3 \geq 70\%$ | $E_3 \geq 75\%$ | $E_3 \geq 80\%$ | $E_3 \geq 85\%$ | $E_3 \geq 90\%$ | $E_3 \geq 90\%$ | $E_3 \geq 95\%$ | $E_3 \geq 95\%$ | $E_3 \geq 95\%$ |

Infection Risk v. Filter Efficiency Rating

Reasons why MERV 13 is minimum recommendation

Ref. NAFA Research on HVAC filtration and the Wells-Riley approach to assessing risks of infectious airborne diseases prepared by Dr. Brent Stephen: Projected risk of infection by influenza virus during a 2-hour stay in a hypothetical hospital waiting room environment with 50 adult occupants and ASHRAE 170 minimum ventilation rates.

http://built-envi.com/publications/nafa_iit_wellsriley%20-%20FINAL.pdf

MERV 13 Filter Shortages

Recommendations Cause Demand >> Supply

- Commercial markets were generally MERV 8 Pre-Filters and MERV 11-15 Final Filters, so supply chain production capability mirrored that demand.
- Market is now showing a 300% MERV 13 increase in demand YOY, 2019-2020.
- Remember that *minimum recommend final filter rating is MERV 13*, consider using higher efficiency MERV 14, 15, 16 filters.
- Remember that *‘or as best achievable’* can include lower efficiency MERV 12, 11, 10, 9 filters. Any increase in MERV rating over existing mitigates risk.
- Will likely adjust over time, consider alternatives as interim, short-term solution vs. final Post-COVID-19, long-term solution.

Meltblown Synthetic Shortages

Competition with PPE Masks & Gowns Cause Demand >> Supply

- Demand + Government 1st Out Contracts has created a Meltblown Synthetic Shortage
- Has created an industry-wide lofted filter media shortage
- Lofted filter media used in higher efficiency products such as MERV 11 – MERV 15 Box Filters and Bag Filters
- Laws of Supply & Demand have created a price driven response across the market

Other Air Cleaning Solutions: UVGI, Air Purifiers

Other Filtration Mitigation Strategies

Air Handlers with Ultra Violet Germicidal Irradiation (UVGI) in Filters

How UV Lights Works in Air Handler Units

The RNA of the virus absorbs the radiant energy which results in breaks and lesions in the chain

Other Filtration Mitigation Strategies

Air Handlers with UV Light in Filters

- UV Lamps are normally placed on the downstream side of the coil and over the drain pan.
- UV Lamps create UVC wavelengths, the most effective on organic matter, including human eyes and skin – use caution.
- Open cell sealing foam, polypropylene synthetic fibers, and other plastics can become brittle or break down completely with prolonged exposure to UVC.
- If UV lights are part of the filtration system, use only non-synthetic filter components (i.e. fiberglass filter media).

Other Filtration Mitigation Strategies

Air Purifiers - built for use with Mechanical Filtration

Air Purifiers use the principle of electrostatic precipitation and are also known as Electrostatic Precipitators and Media Electronic Agglomerators

- Efficiency is highest when the Collector Plates are clean.
- Balances charging strength for efficiency with risk of ozone (O_3) creation

Other Filtration Mitigation Strategies

Filter Recommendations for use with Air Purifiers

- Pre-Filter with a minimum MERV 8 filter to minimize risk of arcing in the Ionizing Section and premature loading in the Collector Section
- Final Filter with a minimum MERV 13 filter to capture agglomerated particles and meet minimum COVID-19 response criteria

Air Filtration Total Cost of Ownership (TCO)

Better Filter Efficiencies at Lower Costs

Air Filters Maintenance Plans

Pick Your Plan!

On the Calendar

On the Pressure Gauge

On the Money

Change Filters “On the Money”

a.k.a. Condition Based Maintenance Plan (CBMP)

Def. – when a filter’s total cost of ownership is at a minimum based on all the costs associated with a filter change out:

- Filter
- Ordering Labor
- Change-out Labor
- Freight
- Disposal
- Energy

Advantages:

- Saves money, lowest cost
- Analysis based on exact system data
- Routine
- Easy to Budget

Disadvantages:

- Requires effort to obtain data

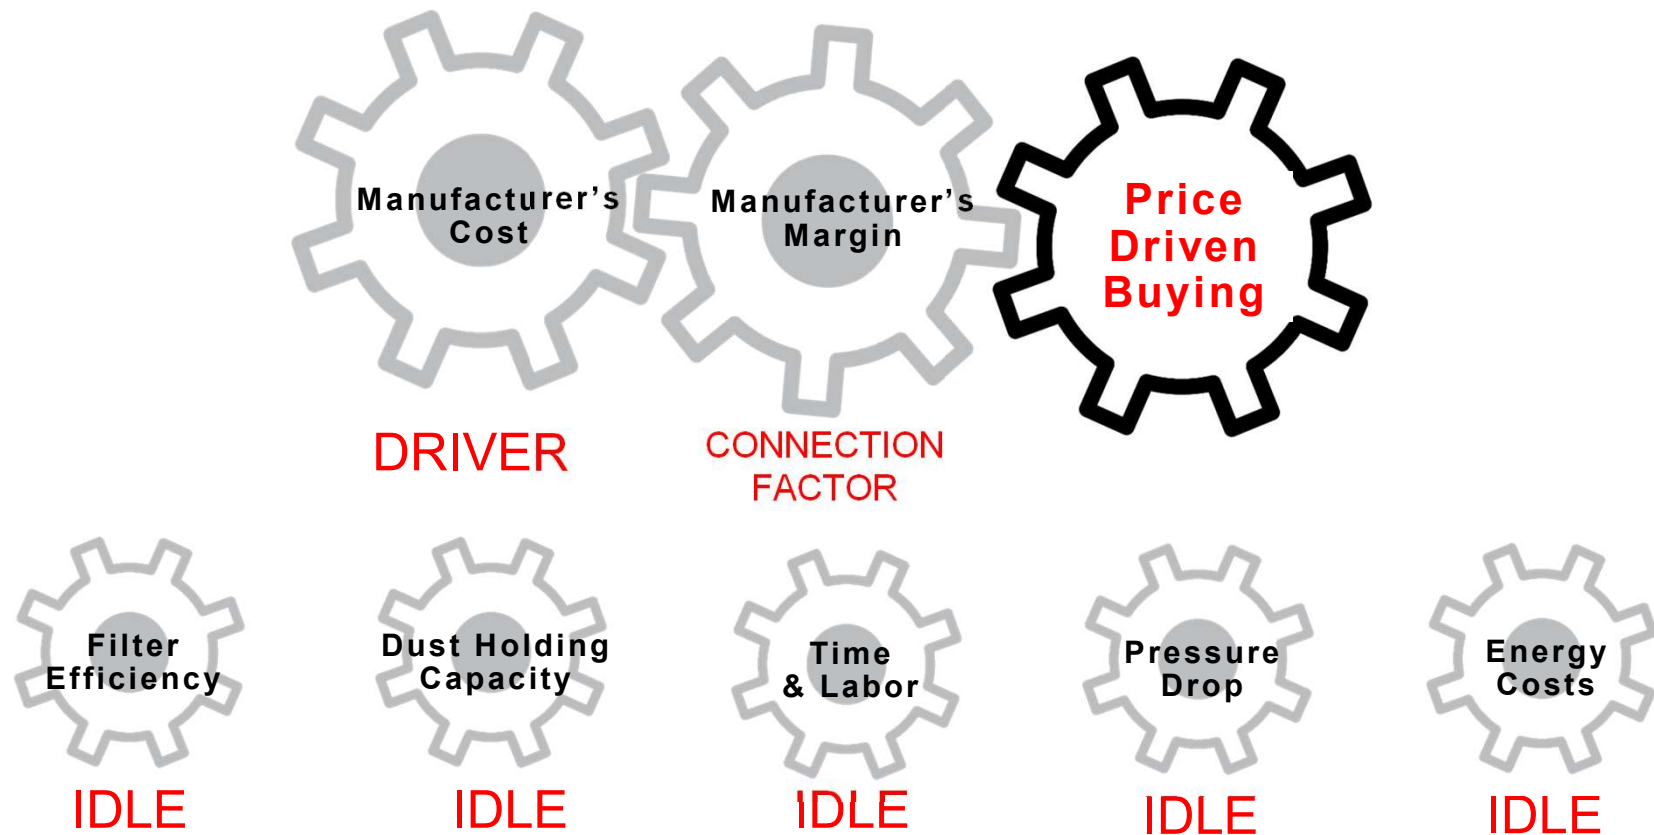

Change Filters “On The Money”

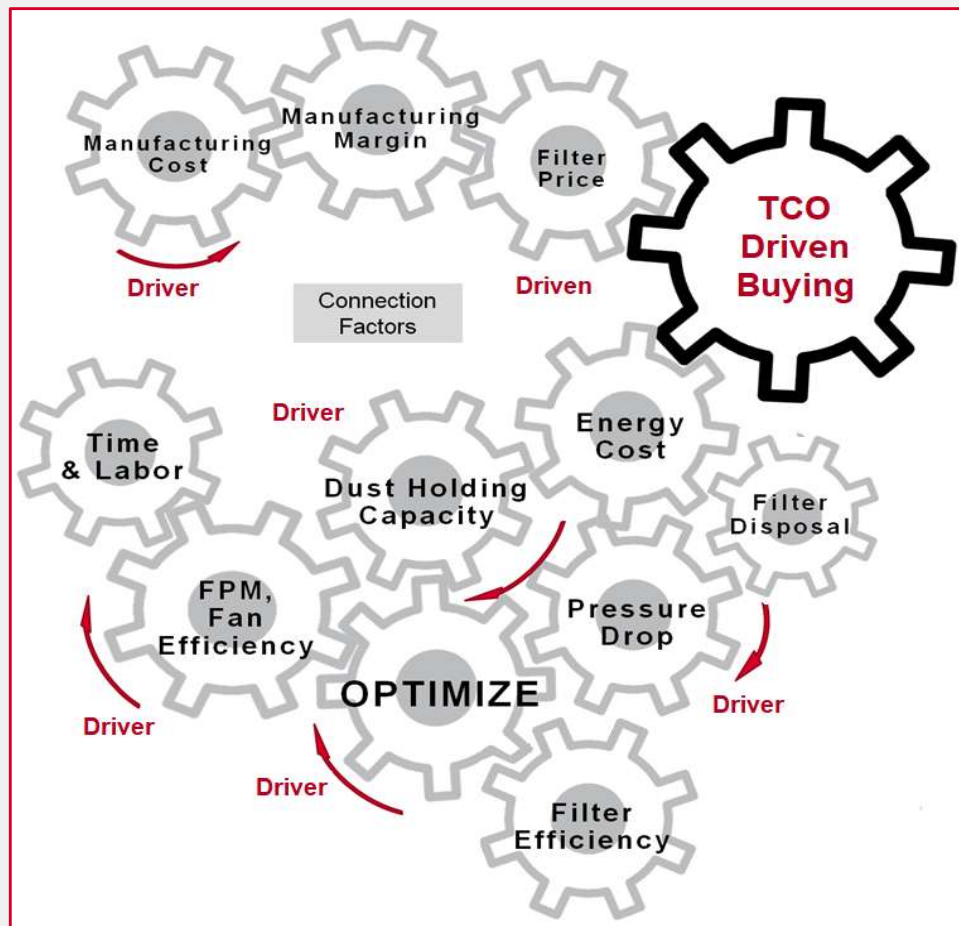

Optimal Operational Cost Analysis

Price-Driven Buying

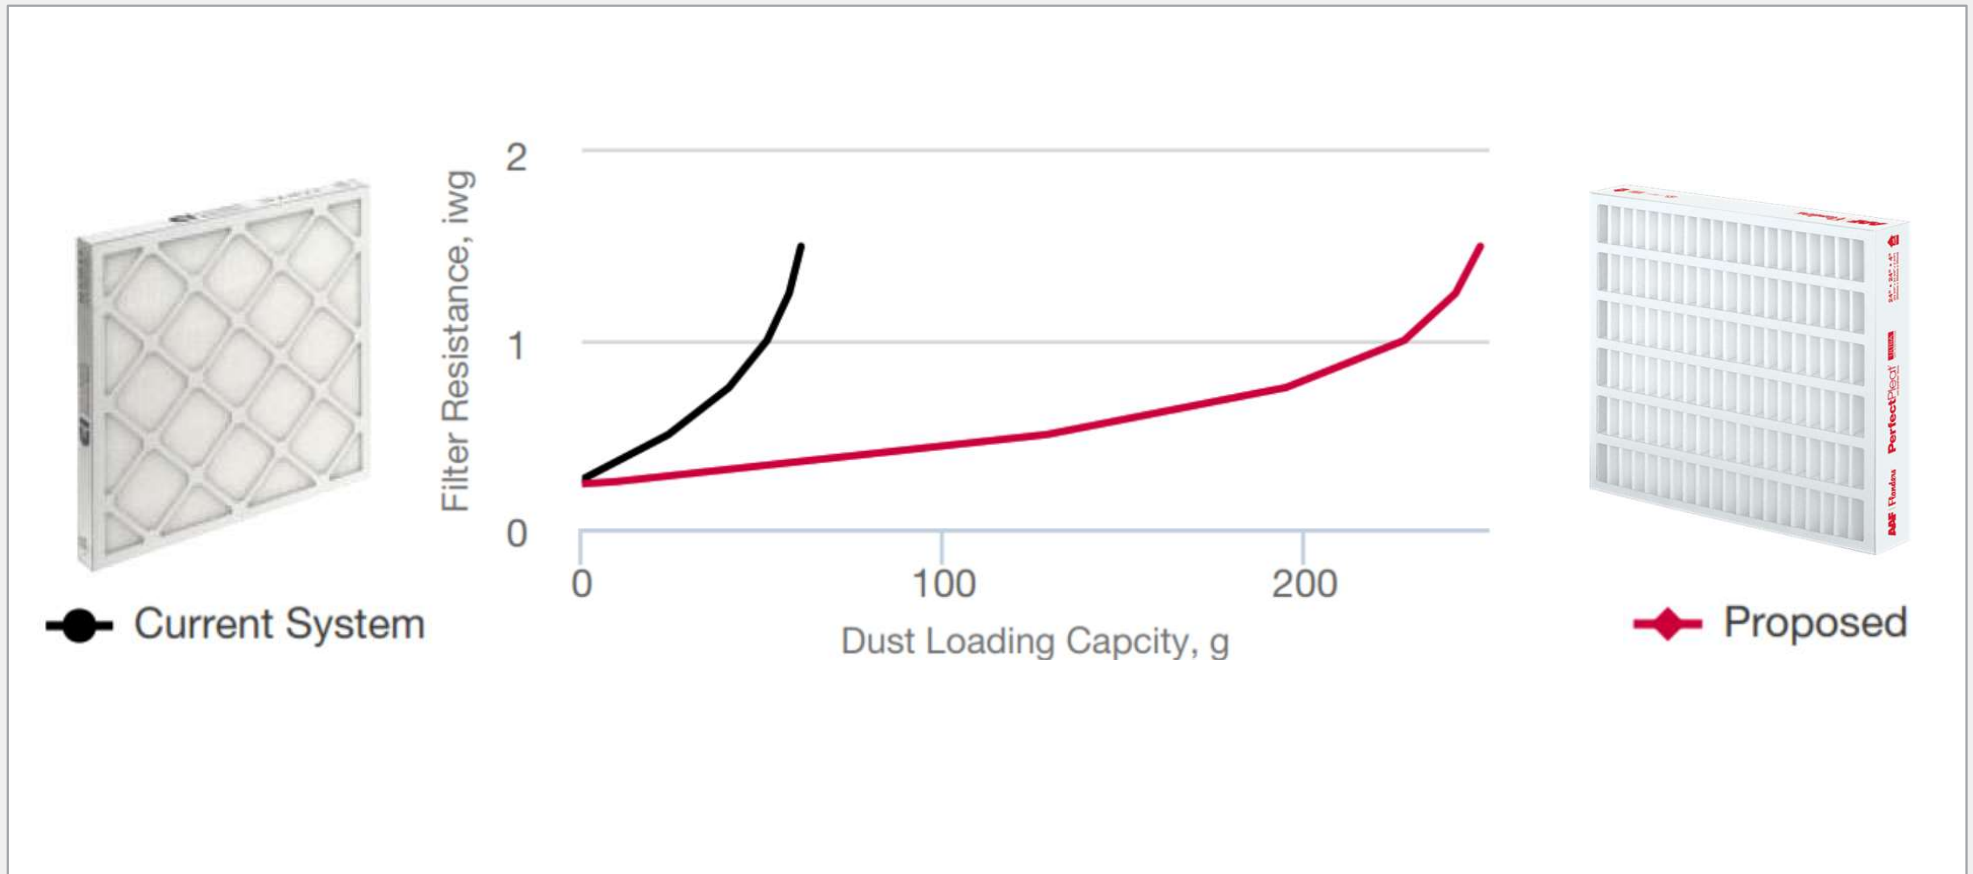

Total Cost of Ownership (TCO) Buying

$$W = \frac{q_V \cdot \overline{\Delta p} \cdot t}{\eta \cdot 1000}$$

W = annual energy consumption (kWh)
q_V = airflow rate (m³/s)
 $\overline{\Delta p}$ = average pressure drop (Pa)
t = annual operating time (hours)
η = fan efficiency (%)

Why Use a Filter Optimization Program?

Savings of Upgrading Air Filters

Is it possible to reduce TCO in a post COVID-19 world?

Moving from a Two-Stage MERV 11 System to a Two-Stage MERV 15

Assumptions:

- 10,000 CFM AHU
- Electricity Cost = \$0.08 kWh
- Average Filter Costs
- Maintenance Costs = \$40/hour
- Freight Costs = \$90/AHU
- Disposal Costs = \$50/AHU
- Dust Loading = 27 grams/month

Savings of Upgrading Air Filters

Annualized Results

Moving from a Two-Stage MERV 11 System to a Two-Stage MERV 15

Results

Koch Filter Corporation
S1: Multi-Pleat™ XL8 SC-M8-2
S2: Multi-Cell™-M11-12

| Total Cost of Ownership \$ Spent Per Year | Current System |
|--|----------------|
| Filter Cost | \$413.3 |
| Energy Cost | \$1,188 |
| Labor Cost | \$243 |
| Disposal Cost | \$96 |
| Other Identified Costs | \$213 |
| Total Cost of Ownership | \$2,154 |
| Environmental Impact (CO ₂ Emissions) | 133.6 |
| Labor Hours Consumed | 6.1 |

**16.3%
Reduction**

Executive Summary

COVID-19 and the Future of Air Filtration

- ▶ Upgrading to HEPA filtration is the recommended best COVID-19 mitigation response.
- ▶ If HEPA filters are not compatible with existing system, upgrading to ASHRAE MERV 16 filtration is the recommend best 'quick' mitigation response.
- ▶ If ASHRAE MERV 16 filters are not compatible with existing filter racks, the minimum recommended upgrade is ASHRAE MERV 13, MERV 14 preferred, or the highest level achievable.
- ▶ COVID-19 Filter upgrade cost increases can be minimized or eliminated with a Total Cost of Ownership (TCO) perspective.
- ▶ TRS offers the full range of AAF Flanders products to provide the best 'fit' for each unique system.
- ▶ TRS and AAF Flanders engineering leadership in COVID-19 mitigation response is available to develop unique mitigation plans.
